How can we access the nutrients we need with less impact on the \_\_\_\_\_? The most significant component of agriculture that contributes to climate change is livestock. Globally, beef cattle and milk cattle have the most significant impact in terms of greenhouse gas emissions(GHGEs), and are responsible for 41% of the world's CO<sub>2</sub> emissions and 20% of the total global GHGEs. The atmospheric increases in GHGEs caused by the transport, land clearance, methane emissions, and grain cultivation associated with the livestock industry are the main drivers behind increases in global temperatures. In contrast to conventional livestock, insects as "minilivestock" are low-GHGE emitters, use minimal land, can be fed on food waste rather than cultivated grain, and can be farmed anywhere thus potentially also avoiding GHGEs caused by long distance transportation. If we increased insect consumption and decreased meat consumption worldwide, the global warming potential of the food system would be significantly reduced.

Do you have trouble \_\_\_\_\_ your computer screen amid the jungle of old coffee mugs and scattered papers? Or is your workspace a minimalist's dream? Whether you're neat or messy, your workspace may reveal a lot about your personality. Every office worker has a particular type of desk they keep. And a number of studies suggest that the state of your desk might affect how you work, from the idea that disorderly environments produce creativity — to the idea that too much mess can interfere with focus. Deliberately or not, we're constantly making statements about ourselves through our personal presentation of the desk. One of the reasons physical spaces, including our office desks, can be so revealing about us is that they're essentially the crystallization of a lot of behavior over time.

There are countless examples of scientific inventions that \_\_\_\_\_ by accident. However, often this accident has required a person with above-average knowledge in the field to interpret it. One of the better-known examples of the cooperation between chance and a researcher is the invention of penicillin. In 1928, Scottish biologist Alexander Fleming went on a vacation. As a slightly careless man, Fleming left some bacterial cultures on his desk. When he returned, he noticed mold in one of his cultures, with a bacteria-free zone around it. The mold was from the *penicillium notatum* species, which had killed the bacteria on the Petri dish. This was a lucky coincidence. For a person who does not have expert knowledge, the bacteria-free zone would not have had much significance, but Fleming understood the magical effect of the mold. The result was penicillin — a medication that has saved countless people on the planet.

Honeybees have evolved what we call "swarm intelligence," with up to 50,000 workers in a single colony coming together to make democratic decisions. When a hive gets too crowded in springtime, colonies send scouts to look for a new home. If any scouts disagree on where the colony should build its next hive, they argue their case the civilized way: through a dance-off. Each scout performs a "waggle dance" for other scouts in an attempt to convince them of their spot's merit. The more enthusiastic the dance is, the happier the scout is with his spot. The remainder of the colony \_\_\_\_\_ with their bodies, flying to the spot they prefer and joining in the dance until one potential hive overcomes all other dances of the neighborhood. It would be great if Congress settled their disagreements the same way.

The world can be a different and better place if, while you are here, you give of yourself. This concept became clear to Azim one day when he was watching television at an airport terminal while waiting for a flight. A priest was sharing a story about newborn twins, one of whom was ill. The twins were in separate incubators, as per hospital rules. A nurse on the floor repeatedly suggested that the twins \_\_\_\_\_ kept together in one incubator. The doctors finally agreed to try this. When the twins were brought into contact with each other, the healthy twin immediately put his arms around his sick brother. This instinctive exchange gradually helped the sick twin to recover and regain his health. The babies' family and the doctors witnessed the intangible force of love and the incredible power of giving.
